

- PE (Portable Executable) is a native executable format on Windows
- PE files:
 - user mode: EXE, DLL
 - kernel mode: driver (.sys), kernel image (ntoskrnl.exe)
 - UEFI (run in SMM System Managemant Mode)
 - Also OBJ files have structures similar to PE

- PE (Portable Executable) contains information:
 - What to execute: the compiled code
 - How to execute: headers with data necessary for loading it

- PE format is based on a Unix format COFF that was used in VAX/VMS
- It was introduced as a part of specification Win32
- Throughout many years, the core of the format didn't change, only some new fields of some structures have been added
- Since introduction of 64 bit environment, PE needed to be adjusted to it: 64 bit PE was introduced
- Also, new variants have been introduced, like .NET PE containing additional structures with intermediate code and metadata

• PE file structure: the DOS part (legacy) and the Windows Part

• DOS Header: only e_magic, and e_lfnew must be filled:

```
typedef struct _IMAGE_DOS_HEADER {
                                    // DOS .EXE header
                                    // Magic number -----
        e_magic;

 LONG
} IMAGE_DOS_HEADER, *PIMAGE_DOS_HEADER;
```

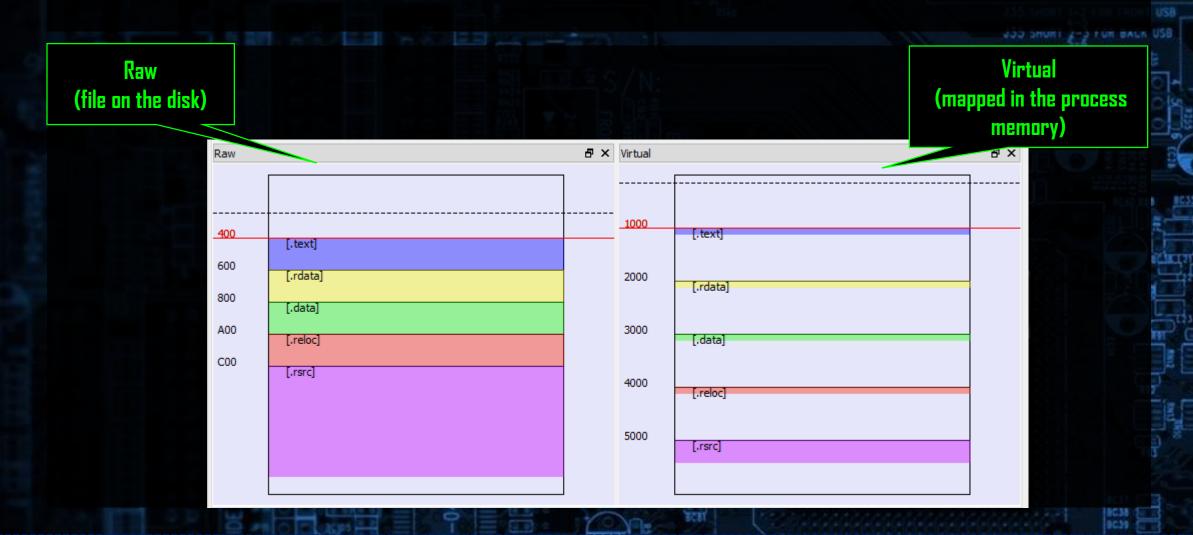

- PE is divided into sections with different permissions
- Sections introduce a logical layout of the binary, that compilers/linkers can follow
- Dividing PE on section improves security: the code is isolated from the data
- HOWEVER:
 - if DEP is disabled, page without execution permission can still be executed
 - The section containing the Entry Point will always be treated as executable

• PE sections are defined by sections header

- on the disk PE is stored in a raw format (the unit is defined by File Alignment)
- In memory PE is mapped to its virtual format (the unit is defined by Section Alignment) usually of the granularity of one page (0x1000)

- 1. PE comes with some default base address in the header
- 2. All the absolute addresses inside the PE assume that it was loaded at this base

- In the past EXEs were usually loaded at their default base (only DLLs didn't have to)
- Nowadays most PEs load at a dynamic base (due to ASLR)
- A flag in the header determines if a dynamic base will be used

 If the PE was loaded at a different base than the one defined in the header, all its fields using absolute addresses must be recalculated (rebased)

•How does PE know where are the fields that needs to be rebased?

- •How does PE know **where** are the fields that needs to be **rebased**?
- •They are listed in the Relocation Table!

- Let's open one of our sample PEs in PE-bear and see the relocation table
- Check the code snippet to see how the relocation table is processed

Exercise time...

Basics of a PE file: Imports & Exports

Most executables use some functions exported by other modules (external libraries)

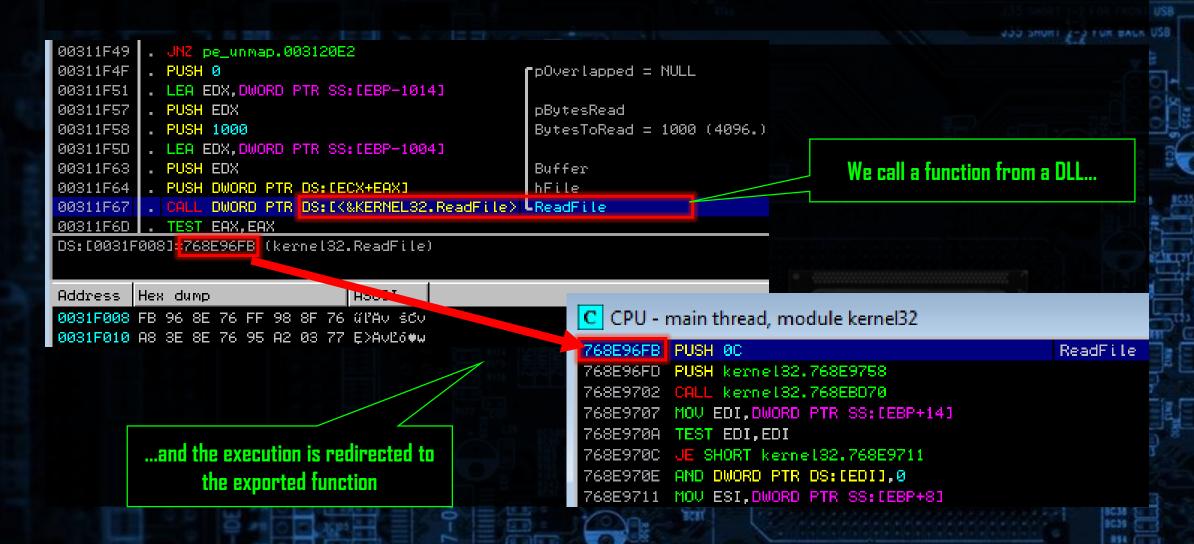

- 1. If we use a static library, the linker will automatically add the external code into our PE
- 2. If we use a dynamic library (DLL), the used functions will be added to the Import Table of our PE, and dynamic linking will be done when the PE is loaded
- 3. Alternatively, we can load a DLL by ourselves using LoadLibrary and fetch the exported function via GetProcessAddress

• Export Table

https://github.com/hasherezade/malware training vol1/blob/main/exercises/module1/lesson2 pe/pe snippets /imports load.h

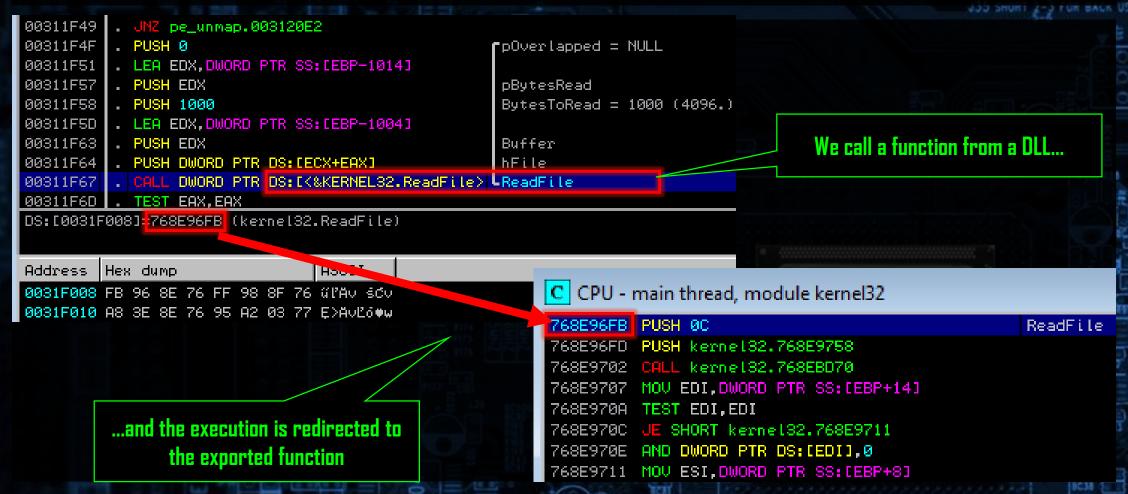

- Dynamic linking is done when a PE is loaded
- The loader walks through the Import Table of the PE
 - loads needed DLLs
 - searches the imported functions in the export table of the DLL
 - fills the thunks via which the PE is going to make calls to the exported functions with appropriate addresses

Basics of a PE file: Imports & Exports

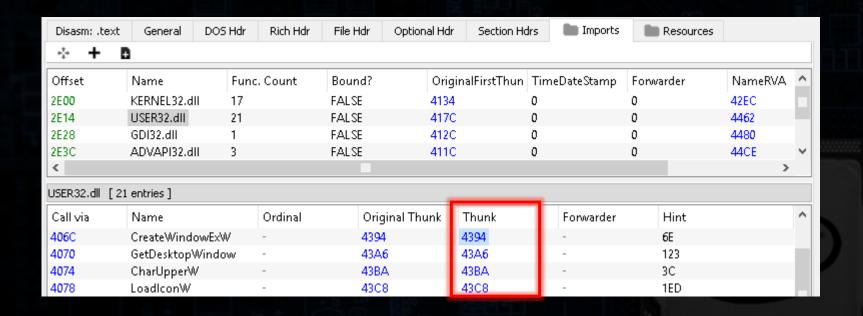

BBC2

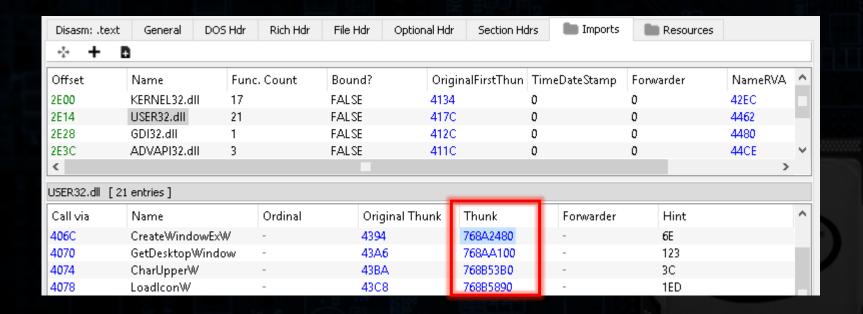

Basics of a PE file: Imports & Exports

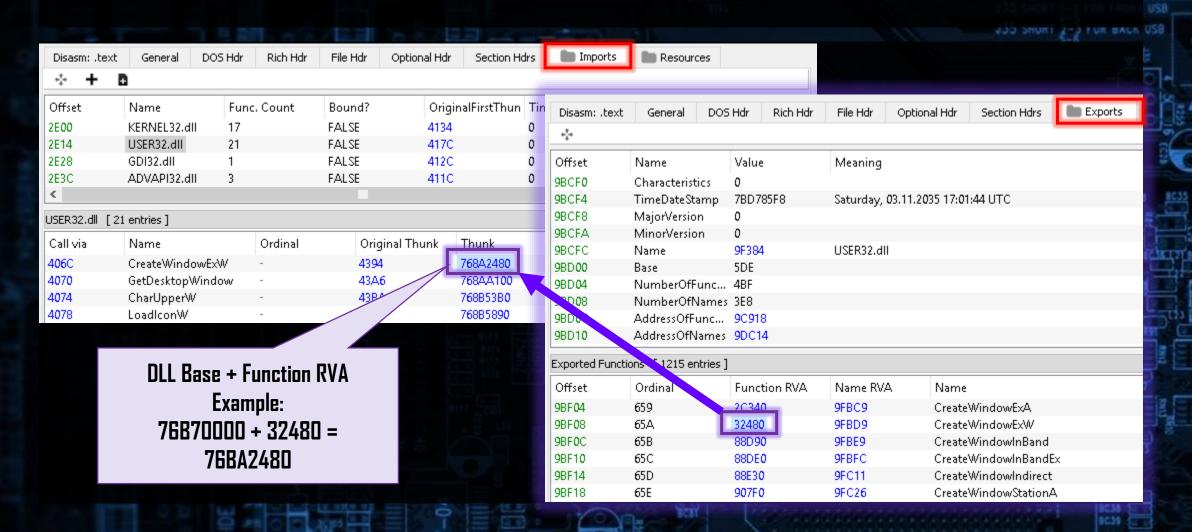

• Raw: before filling imports

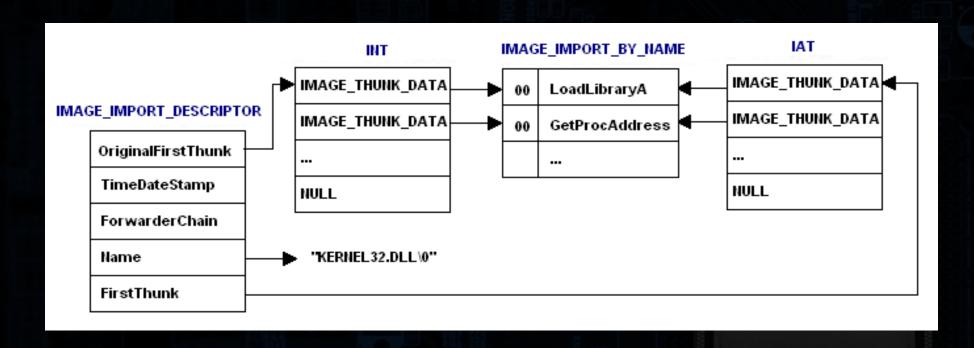

Loaded: after filling imports – thunks are filled with addresses of exported functions

• Import Table: structure

- Let's open one of our sample PEs in PE-bear and see the import table. Find the corresponding DLLs and their exports.
- Check the code snippets to see how the import and export tables are processed

Exercise time...

- Compile the given code of a custom PE loader and get familiar with it
